

COMMUNICATION APPARATUS

CLAIMS

What is claimed is:

- 1 1. A communications apparatus comprising:
2 a receiving unit operable to receive link status flags, the
3 link status flags included in frames received over a data
4 communication link in response to link status flags included in
5 frames transmitted over the data communication link; and
6 a link status determination unit operable to determine
7 whether a condition of the data communication link is normal
8 based on whether the link status flags are received within a
9 predetermined time.
- 1 2. The communication apparatus according to claim 1,
2 wherein the link status determination unit is further operable to
3 determine that the condition of the data communication link is
4 invalid when the link status flags are not received within the
5 predetermined time.
- 1 3. The communication apparatus according to claim 2,
2 further comprising a link control unit operable to close the data
3 communication link when the data communication link is
4 determined to be invalid.

1 4. The communication apparatus according to claim 3,
2 wherein the link control unit is further operable to open the data
3 communication link when the recovery of the data
4 communication link is determined to be possible.

1 5. The communication apparatus according to claim 4,
2 further comprising a negotiation unit operable negotiate validity
3 or invalidity of the data communication link with a link status
4 determination unit of another device connected to the data
5 communication link.

1 6. The communication apparatus according to claim 5,
2 wherein the negotiation unit is further operable to transmit
3 information requesting validity or invalidity of the data
4 communication link to the link status determination unit of the
5 other device connected to the data communication link and to
6 receive a response from the link status determination unit of the
7 other device connected to the data communication link.

1 7. The communication apparatus according to claim 6,
2 further comprising a setting unit operable to set the link status
3 determination unit to a valid or invalid condition.

1 8. The communication apparatus according to claim 7,
2 wherein the negotiation unit is further operable to transmit
3 information indicating a valid condition of the link status
4 determination unit to the other device connected to the data
5 communication link and the setting unit is further operable to set
6 the link status determination unit to an invalid condition when
7 the negotiation unit receives response indicating invalidity of the
8 link status determination unit of the other device connected to
9 the data communication link.

1 9. The communication apparatus according to claim 7,
2 further comprising a link monitoring unit which is operable when
3 the link status determination unit is set to an invalid condition
4 and is operable to transmit an inspection frame to inspect a
5 condition of the data communication link to the other device
6 connected to the data communication line and to determine that a
7 condition of the data communication link is normal upon
8 receiving a response frame for the inspection frame from the
9 other device connected to the data communication line within the
10 predetermined time.

1 10. The communication apparatus according to claim 4,
2 further comprising:
3 a transmitter operable to transmit transmission object data
4 received from a data transmission source over the data

5 communication link; and
6 a data transmission control unit operable to suspend data
7 transmission to the data transmission source when the data
8 communication link is closed.

1 11. The communication apparatus according to claim 10,
2 wherein the data transmission control unit is further operable to
3 re-start data transmission to the data transmission source when
4 the data communication link is re-opened.

1 12. The communication apparatus according to claim 4,
2 further comprising:
3 a transmitter operable to transmit transmission object data
4 received from a data transmission source over a data link layer
5 of the data communication link; and
6 a data transmission control unit operable to suspend data
7 transmission to the data transmission source when the data
8 communication link is closed.

1 13. The communication apparatus according to claim 12,
2 wherein the data transmission control unit is further operable to
3 re-start data transmission to the data transmission source when
4 the data communication link is re-opened.

✓
1 14. A data link monitoring control method for
2 communication apparatus comprising the steps of:
3 receiving unit link status flags, the link status flags
4 included in frames received over a data communication link in
5 response to link status flags included in frames transmitted over
6 the data communication link; and
7 determining whether a condition of the data
8 communication link is normal based on whether the link status
9 flags are received within a predetermined time.

1 15. The method according to claim 14, further comprising the
2 step of:
3 determining that the condition of the data communication
4 link is invalid when the link status flags are not received within
5 the predetermined time.

1 16. The method according to claim 15, further comprising the
2 step of:
3 closing the data communication link when the data
4 communication link is determined to be invalid.

1 17. The method according to claim 16, further comprising the
2 step of:
3 opening the data communication link when the recovery
4 of the data communication link is determined to be possible.

1 18. The method according to claim 17, further comprising the
2 step of:
3 negotiating validity or invalidity of the data
4 communication link another device connected to the data
5 communication link.

1 19. The method according to claim 18, further comprising the
2 steps of:
3 transmitting information requesting validity or invalidity
4 of the data communication link to the other device connected to
5 the data communication link; and
6 receiving a response from the other device connected to
7 the data communication link.

1 20. The method according to claim 19, further comprising the
2 step of:
3 setting the link status determination unit to a valid or
4 invalid condition.

1 21. The method according to claim 20, further comprising the
2 steps of:

3 transmitting information indicating a valid condition to
4 the other device connected to the data communication link; and
5 setting an invalid condition indicating invalidity of the
6 other device connected to the data communication link.

1 22. The method according to claim 20, further comprising the
2 step of:

3 transmitting an inspection frame to inspect a condition of the
4 data communication link to the other device connected to the
5 data communication link; and
6 determining that a condition of the data communication
7 link is normal upon receiving a response frame for the inspection
8 frame from the other device connected to the data
9 communication line within the predetermined time.

1 23. The method according to claim 17, further comprising the
2 steps of:

3 transmitting transmission object data received from a data
4 transmission source over the data communication link; and
5 suspending data transmission to the data transmission
6 source when the data communication link is closed.

1 24. The method according to claim 23, further comprising the
2 step of:
3 re-starting data transmission to the data transmission
4 source when the data communication link is re-opened.

1 25. The method according to claim 17, further comprising the
2 step of:
3 transmitting transmission object data received from a data
4 transmission source over a data link layer of the data
5 communication link; and
6 suspending data transmission to the data transmission
7 source when the data communication link is closed.

1 26. The method according to claim 25, further comprising the
2 step of:
3 re-starting data transmission to the data transmission
4 source when the data communication link is re-opened.
